Clinical Applications for Motor Control is a comprehensive text that will help bridge the gap between motor control/motor learning research and practical clinical applications. Written by a variety of physical therapists with a broad range of clinical expertise areas such as neurophysiology, biomechanics, and human motor control, this text is rich in a multitude of topics. The case-study format that is applied throughout the text amplifies the principles of motor control research and demonstrates the transfer of information from research studies to clinical settings. Incorporated throughout Clinical Applications for Motor Control are the concepts and language of the Guide to Physical Therapist Practice. The text begins with an introductory and historical review of traditional neurophysiologic treatment approaches and new theoretical alternatives. This comprehensive review establishes a foundation for the remaining chapters that address topics such as motor control, learning and development; musculoskeletal considerations; sensory and cognitive systems underlying the production and control of movement; disorders of the control of limb movement; and gait. Five case studies representing common clinical problems are included throughout the text to facilitate clinical problem solving. This innovative style is geared towards the student who has limited clinical experience, while also serving as a useful reference for the practicing clinician.

This book is a comprehensive climatic monograph, which addresses one of the most complex mountain environments in Europe, the Carpathians Chain, focusing on the branches that lie over Romania. The volume aggregates high quality input data, state-of-the-art techniques, regional analysis and overview perspectives, while addressing the spatial and temporal patterns of the main climatic elements. The study covers the period 1961-2010, for the present climate, while the perspective is extended up to 2050. The main climatic elements (e.g. air temperature, precipitation, wind) are analyzed, but some specific variables like snow depth and snow cover are also examined, both in terms of average behaviour and extreme characteristics. This is the first synthesis addressing the climate of this mountain region, and it provides useful information for scientists, mountain stakeholders, decision-makers and general public.

Muscle Function Testing provides information pertinent to the muscle functions. This book evaluates the method of examination that provides information about the strength of individual muscles or muscle groups that form a functional unit. Organized into three sections encompassing four parts, this book begins with an overview of the size, extent, and progress of peripheral nerve lesions. This text then discusses the nature of the simple

movement pattern seen in muscle function testing. Other chapters consider the conditions for analytical physiotherapy and determination of the work capacity of the part of the body being tested. This book discusses as well the possible errors and mistakes that might occur during testing and might decrease the validity of the assessment. The final chapter deals with the demand for a better and a more rational method to therapeutic exercise. This book is a valuable resource for physiotherapists, orthopedic surgeons, physiologists, neurologists, and rheumatologists.
