The series Topics in Current Chemistry presents critical reviews of the present and future trends in modern chemical research. The scope of coverage is all areas of chemical science including the interfaces with related disciplines such as biology, medicine and materials science. The goal of each thematic volume is to give the non-specialist reader, whether in academia or industry, a comprehensive insight into an area where new research is emerging which is of interest to a larger scientific audience. Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole. The most significant developments of the last 5 to 10 years are presented using selected examples to

illustrate the principles discussed. The coverage is not intended to be an exhaustive summary of the field or include large quantities of data, but should rather be conceptual, concentrating on the methodological thinking that will allow the non-specialist reader to understand the information presented. Contributions also offer an outlook on potential future developments in the field. Review articles for the individual volumes are invited by the volume editors. Readership: research chemists at universities or in industry, graduate students.

The now-classic introduction to designing typography, handsomely redesigned and updated for the digital age In this invaluable book, Karen Cheng explains the processes behind creating and designing type, one of the most important tools of graphic design. She addresses issues of structure, optical compensation, and legibility, with special emphasis given to the often-overlooked relationships between letters and shapes in font design. In this second

edition, students and professional graphic designers alike will benefit from an expanded discussion of the creative practice of designing type—what designers need to consider, their rationale, and issues of accessibility—in the context of contemporary processes for the digital age. Illustrated with more than 400 diagrams that demonstrate visual principles and letter construction, ranging from informal progress sketches to final type designs and diagrams, this essential guide analyzes a wide range of classic and modern typefaces, including those from many premier type foundries. Cheng's text covers the history of type, the primary systems of typeface classification, the parts of a letter, and the effects of new technology on design methodology, among many other key topics.

"In The Meaning of Color in Ancient Mesopotamia, Shiyanthi Thavapalan offers the first in-depth study of the words and expressions for colors in the Akkadian language (c. 2500-500 BCE). By combining philological

analysis with the technical investigation of materials, she debunks the misconception that people in Mesopotamia had a limited sense of color and convincingly positions the development of Akkadian color language as a corollary of the history of materials and techniques in the ancient Near East"--

Kleur zal in de nabije toekomst een prominente rol gaan spelen binnen het moderne letterontwerpen en de typografie. Het?Novo Typo Color Book? is het resultaat van een onderzoek naar het gebruik hiervan. Voor deze uitgave heeft Van Wageningen een serie meerkleurige lettertypes ontworpen waarmee alle denkbare mogelijkheden en combinatie worden geïllustreerd. Hij toont dat kleur en meerkleurige lettertypes een interessante en waardevolle toevoeging zijn binnen het hedendaagse (typo)grafische ontwerp. Het concept wordt helder toegelicht en gevisualiseerd. Speciaal voor dit project zijn een serie nieuwe matrijzen en loden letters geproduceerd waarmee een gedeelte gedrukt is

op een historische drukpers.

Today, the reality we know can be recorded and reproduced true to reality using technical processes. Space and time are recreated virtually as a copy in artificial reality. However, the reproduction of virtual reality is not limited to a mere copy of what exists. A visitor to the virtual space does not have to be content with the pixelated image of the old familiar, but can encounter unreal phenomena in the illusory world that never existed in real life or are even physically impossible. This enables an expansion of the recorded reality and allows the perception of surprisingly new perspectives. A perspective denotes the perception of a fact from a certain point of view and corresponds to the way of looking at things. But a perspective is also the observation of a scene from a viewing position. From different perspectives the illusion of reality arises during the reproduction by observation. This vision is not based on imagination or hallucination, but is the

basic function of virtual reality. This book describes the concepts, systems, and technologies used to create virtual reality from its ancient beginnings to the present, and provides a glimpse into a possible future. This book is a translation of the original German 1st edition Grundlagen der virtuellen Realität by Armin Grasnack, published by Springer-Verlag GmbH Germany, part of Springer Nature in 2020. The translation was done with the help of artificial intelligence (machine translation by the service DeepL.com). A subsequent human revision was done primarily in terms of content, so that the book will read stylistically differently from a conventional translation. Springer Nature works continuously to further the development of tools for the production of books and on the related technologies to support the authors. widely used 28th edition of Nestle-Aland's Novum Testamentum Graece and the 5th edition of the United Bible Society Greek New Testament, a computer-assisted method known as the Coherence-Based Genealogical Method (CBGM) was used for the first time to determine the most valuable witnesses and establish the initial text. This book offers the first full-length, student-friendly introduction to this important new method. After setting out the method's history, separate chapters clarify its key concepts, including genealogical coherence, textual flow diagrams, and the global stemma. Examples from across the New Testament are used to show how the method works in practice. The result is an essential introduction that will be of interest to students, translators, commentators, and anyone else who studies the Greek New Testament. In this remarkable book, Dr. H.H. Ninninger often called the world's foremost meteorite expert, recounts the excitement of his long love affair with "falling stars"—those "stones from the sky" that rain down upon our earth from outer

space in great, but little known profusion. Fifty years ago the science of meteorites was at a low ebb. Nothing much had been done since 1900. It was Dr. Nininger's keen interest, however, that brought about a resurgence in an old science. His efforts, described with straightforward ease, account for more than half the "falls" recorded in the 20th century.

Electrochromic materials, both organic and inorganic, have widespread applications in light-attenuation, displays and analysis. Written in an accessible manner, this book provides a comprehensive treatment of all types of electrochromic systems and their many applications. Coverage develops from electrochromic scope and history to new searching presentations of optical quantification and theoretical mechanistic models. Non-electrode electrochromism and photo-electrochromism are summarised, with updated comprehensive reviews of electrochromic

oxides (tungsten-trioxide particularly), metal coordination complexes and metal-cyanometallates, viologens and other organics; and more recent exotics such as fullerenes, hydrides, and conjugated electroactive polymers are also covered. The book concludes by examining device construction and durability. With an extensive bibliography, recent advances in the field, modern applications and a step-by-step development from simple examples to sophisticated theories, this book is ideal for researchers in materials science, polymer science, electrical engineering, physics, chemistry, bioscience and (applied) optoelectronics.
